

PYTHON DICT METHODS

In Python - a **Dictionary** is a data structure used to store values in the form of **key:value pairs**

Items are **Ordered** (they exist in a defined order), and **Changeable** (they can be altered, adding, removed after creation)

Dicts do not allow **duplicate** keys (but different keys could have the same associated value)

There are many important **methods** that can be used with Dictionaries...

.get()

Returns the **value** associated
with a specified **key**

.update()

Updates your dictionary with a
new key:value pair

.fromkeys()

Creates/Returns a dictionary
based upon pre-specified keys &
values

.keys()

Returns all of the **keys** from your dictionary

.values()

Returns all of the **values** from
your dictionary

.items()

Returns all of the **key:value pairs** from your dictionary (each returned as a tuple)

`.pop()`

Removes (and returns) the key and value for a **specified key**

`.popitem()`

Removes (and returns) the **most recently added** key:value pair

.copy()

Returns a **copy** of your dictionary

.clear()

Removes all elements of your
dictionary

Want to land an
incredible role in the
exciting, future-proof,
and lucrative field of
Data Science?

DATA SCIENCE INFINITY

"I had over 40 interviews without an offer. After **DSI** I quickly got **7 offers** including one at **KPMG** and my amazing new role at **Deloitte!**"

- Ritesh

"The **best program** I've been a part of, hands down"

- Christian

"DSI is **incredible** - everything is taught in such a clear and simple way, even the more complex concepts!"

- Arianna
